UNIT 1: Choice of architectures and programming tools.

Exercises II

1. What does API stand for?

   Application Programming Interface

2. Explain what is an API using your own words.

   Una API es el software que comunica el front end con el back end

3. A frontend application needs a list of products from the server. Which of these is most likely an API request?

   A) GET /api/products

   B) CREATE DATABASE products

   C) HTML products

   D) LOGIN products

4. What is the purpose of an API between a frontend and a backend?

   Comunicar y transferir datos entre ambos softwares

5. A frontend sends:

   GET /api/products

   The server responds:

   [

   {"id": 1, "name": "Laptop"},

   {"id": 2, "name": "Keyboard"}

   ]

   What has happened here?

   La API con una operacion get mostro todos los productos que habia na base de datos en formato JSON

6. What is the difference between an API endpoint and a database?

   La API es la que se comunica con la base de datos mientras que la base de datos solo almacena los datos

7. What is the most common format in the API responses?

   El formato mas comun es el formato Json

8. Which methods does a REST API use?

   Usa los metodos HTTP ,get, create , update , delete

9. In which type of apps is it recommended to use a REST API?

   En aplicaciones donde tienes que comunicar un front end con un backend

10. Explain with your own words the meaning of “stateless”.

    Sen estado o servidor non garda a memoria de las peticiones pasadas dun cliente

11. What is the purpose of the PUT method?

    Actualiza el producto

12. You want to get a list of products. Which HTTP method would you use?

    Usas es el metodo get

13. You want to create a new account. Which HTTP method would you use?

    Usas el metodo post

14. You want to update a user's information. Which HTTP method would you use?

    Usas el metodo put

15. You want to remove a product. Which HTTP method would you use?

    Usas el metodo delete

16. If an API returns 404, what might have gone wrong?

    Cuando devuelve el fallo 404 significa que el servidor no encontro la peticion que le pediste
